Classical Mechanics

- ▶ In classical mechanics, the space of all possible states of a system is given by *phase space*, M .
- ▶ “*State*” means not just the *position* but also the *momentum* (of a particle).

Example

For a particle of unit mass, energy function $E : M \rightarrow \mathbb{R}$:

$$E(x, p) = \frac{p^2}{2} + V(x).$$

$$\rightsquigarrow \frac{\partial E}{\partial x} = \frac{\partial V}{\partial x} = -\frac{\partial p}{\partial t}, \quad \text{and} \quad \frac{\partial E}{\partial p} = p = \frac{\partial x}{\partial t}.$$

Quantum Mechanics

- ▶ Still have phase space M and energy E , but replaces states with *wavefunctions*.
- ▶ Classical energy function $E : M \rightarrow \mathbb{R}$ now becomes an operator $\hat{E} : M \rightarrow M$.

Example

State dynamics for a wavefunction $\psi : M \rightarrow \mathbb{C}$ are now described by solutions to *Schrödinger's equation*:

$$\frac{d\psi}{dt} = -\frac{i}{\hbar} \hat{E}\psi.$$

A Question

For a phase space M , what is $\mathcal{Q}(M)$?

- ▶ Phase space M represents the position and momentum of a system, with energy function $E : M \rightarrow \mathbb{R}$.
- ▶ Quantisation $\mathcal{Q}(M)$ should then represent the wavefunctions $\psi : M \rightarrow \mathbb{C}$, with operators $\hat{E} : M \rightarrow M$.

Fock Space

A good candidate for $\mathcal{Q}(M)$ is *Fock space*:

$$\mathcal{Q}(M) := \left\{ \Psi(z) = e^{-|z|^2} \psi(z) : \psi \text{ holomorphic, } \int_M |\Psi|^2 < \infty \right\}.$$

Projective Space
